lamp in this lighting system. In this way, 20% to 40% of the light may be directly diffused downward on the working surface. The remaining 60% to 80% of the light may be directly towards the ceiling and walls. Such directed lighting is reflected downward to the working surface. This form of lighting is intermediate between direct lighting and indirect lighting.

5. General Diffuse Lighting:

An equal amount of light is diffused directly and indirectly by its reflection from ceiling and walls in this type of lighting system. This system gives more light with the same wattage than the semi-indirect lighting system does.

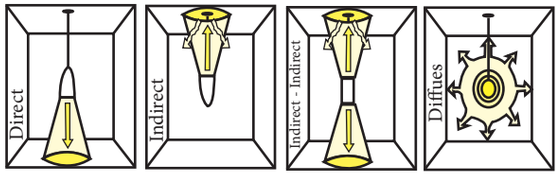

Fig. 3.4. Types of Lighting

3.5.2. Ventilation:

Ventilation in the office refers to the supply of clean and fresh air in the right amount, at the right temperature and of the right humidity. Proper ventilation is an important aspect of office environment. Fresh air must pass through the office regularly. Arrangements of rooms and partitions should be such as to allow free circulation of fresh and dustless air. The following methods are generally used to maintain proper ventilation:

(i) Natural Ventilation: Natural ventilation may be obtained by providing enough doors, windows and ventilators of the right type at the right place. Natural ventilation can be increased by providing roof ventilation and internal tube ventilators. They would ensure a regular flow of fresh air from outside and of decayed air from inside.

(ii) Artificial Ventilation: Artificial ventilation may be achieved by the use of electric fans, exhaust fans, air coolers, air filters, air conditioners etc in the toilets, basements, crowded rooms, canteens, machine rooms etc so that the warm air is let out and fresh air enters through windows and doors.

Temperature and Humidity: Temperature and humidity are two vital factors in the office that exercise a great influence over the worker and his output. Temperature and humidity in the rooms should be maintained at a proper level because too much heat or cold induces physical discomfort and affects the efficiency of the staff. The ideal office temperature is approximately 68 degree fahrenheit and humidity is between 40 to 60 percent.

Do You Know?

- Leaving a fan running overnight over the summer wastes enough energy to power the laptop for a year and iPhone for 25 years.
- A two degree increase in office temperature creates enough carbon di oxide in a year to fill a hot air balloon.

Freedom from Noise:

A noisy place is never an efficient office. Noise is one of the great disturbers.
