FABRIC PRODUCTION

U6UIZV

LEARNING OBJECTIVES

- **To understand the concepts of fabric production techniques.**
- **To gain knowledge about the various terms used in weaving, knitting and non woven.**

5.1 INTRODUCTION

Fabric can be made by different methods. Fabric is the combination of yarns to make a full sheet. Fabric can be made by weaving, knitting and non-woven techniques. Weaving and knitting methods require long yarns but non-woven method can use small fibres also. Weaving is the name given to the interlacing of two sets of yarns, warp and weft at right angles and the fabric thus formed is called as woven fabric. The warp yarns are those yarns which lie in the lengthwise direction of a fabric and the crosswise yarns are called weft. The direction of the yarns is considered important in garment designing. The lengthwise edge of fabric is called selvedge. Grain indicates the direction of the warp or weft yarn. If the yarns are not at right angle, it is called off grain.

5.2 DIFFERENCE BETWEEN WARP AND WEFT

S.No.	Warp	Weft
1.	Warp yarns are stronger	Weaker yarns can also be used
2.	If twist is more then the length of yarns per inch is also more	Twist and length of yarns per inch is less
3.	Ply is preferred for warps	Singles can be used
4.	Stretchability is low	Stretchability is high
5.	Plain yarns are more preferred	Novelty yarns and textured yarns can be used
