Activity 1

Prepare recipes using low cost iron rich food sources for breakfast kunch and dinner for an adolescent girl with anemia

(iv) Iodine

- **Distribution:** It is one of the essential micronutrients required for normal growth and development of human brain and body. Human body contains a total of 15-20 mg of iodine. Thyroid gland contains 75% of iodine and is an essential constituent of thyroxine the active principle of thyroid gland
- **Functions:** Iodine though required in small quantities is needed to perform the following functions
  - Synthesis of thyroxine which regulates growth, development and reproduction.
  - Helps the thyroid hormones to increase and regulate the processes of brain function
  - Enables the thyroid hormones to regulate the conversion of carotene to active vitamin A.
- **Food sources:**
  Marine fish and eggs are good sources of iodine. Based on the dietary pattern and analysis of raw foods, iodine content of various regional diets range from 170-300 µg/ day
- **Deficiency:** It covers a collection of disorders at all stages of human growth and development.

  Goiter: Goiter is the enlargement of thyroid gland which results when iodine is not available in sufficient quantities to produce normal quantity of thyroxine. It also arises from eating foods (goitrogens) that inhibit the synthesis of thyroxine.

REMEMBER

21st October is Global Iodine Deficiency Disorder Day

Cretinism: A congenital disease resulting from a lack of iodine and thyroxin secretion characterized by physical deformity, dwarfism, mental retardation and often goiters.
