extra water to cook some other food.

- Do not use cooking soda. Use of tamarind or lemon juice helps to conserve the vitamins.
- Cook rice in just enough water which gets absorbed during cooking.
- Cook in a pan which has a well fitting lid. When you cook in an uncovered pan most nutrients are lost.
- Do not overcook the food as many nutrients will be destroyed.

Activity 5

You love to eat boiled rice and dhal. Rice has to be boiled with lots of water and the extra water is thrown away. You know that throwing this water means we throw away the soluble nutrients present in rice.

Why is it necessary to break this habit?

How can this problem be solved?

3.7 FORTIFICATION AND ENRICHMENT

Fortification is adding nutrients to the food even though the nutrient is already present in food. Fortification is done to improve the nutritive value whereas the process of improving the nutrient levels of nutrients which might be lost during processing in foods by special methods is called Enrichment.

Importance of Enhancing Nutritive Value of Food

- To meet the nutritional requirements of the body.
- To make proper selection and preparation of foods.
- To consume food in a balanced manner.
- To improve the flavour and texture of the food.
- To get variety in food.
- To assist in planning the daily menu, keeping in view the nutrient content of the food.
- To prevent deficiency diseases in the body.
- To develop good food habits.

Methods of Enrichment of Nutrients

There are three methods by which one can enhance or increase the nutrients present in food.

i) Combination
ii) Fermentation
iii) Germination

i) Combination

Combination is the process of combining cheaper and commonly available foods from different food groups to improve the quality of nutrients.

Combining of foods from different food groups is the easiest way of eating all nutrients.

Combination of foods
