APPENDIX 2

Table A1.1 Systematic developments in Physics over centuries

Observation of motion of Sun, Stars, Planets and Moon	Around 3000 BC (Early Greeks)
In the universe everything is changing. Nothing remains in the same state indefinitely. The idea of 'time' started with this understanding.	Around 500 BC (Heraclitus).
Everything is composed of entirely small indivisible elements called 'atoms'. Development of theory of 'atomism'. But that time it is a hypothesis. No experimental proof.	End of 500 BC (Democritus and Leucippus)
▪ Idea of natural laws behind every day phenomena ▪ Idea of motion with gravity ▪ Theory of four elements(Everything is made up of Earth, water, fire, air able to inter-transform into each other) ▪ Earth is centre of universe(Hypothesis) ▪ Force is required to move the object ▪ Heavier object falls faster towards Earth than lighter object	Around 3rd century BC (Aristotle)
▪ Earth is sphere ▪ Measurement of radius of the Earth almost accurately	Around 240 BC (Eratosthenes)
