OBSERVATIONS To find the acceleration due to gravity 'g'

Length of the pendulum L (metre)	Time taken for 10 oscillations t (s)			Period of oscillation $T = \frac{t}{10}$ (s)	T^2 (s^2)	$g = \frac{4\pi^2 L}{T^2}$ m s^{-2}
	Trial 1	Trial 2	Average			
					Mean g =	

MODEL GRAPH

$slope = \frac{\Delta y}{\Delta x} = \frac{T^2}{L}$; 1/slope = L/T²

RESULT

The acceleration due to gravity 'g' determined using simple pendulum is found to be

i) By calculation = ... m s^{-2}

ii) By graph = ... m s^{-2}
