The Revolution in Chemistry

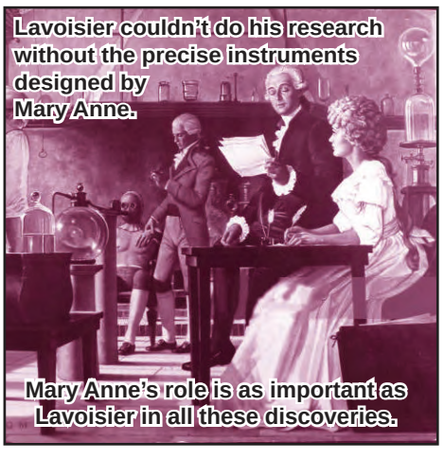

Lavoisier studied chemistry, Botany, Astronomy and Mathematics in Mazarin College. He also studied Law as per his father's wish.

In 1771, he married Mary Anne.

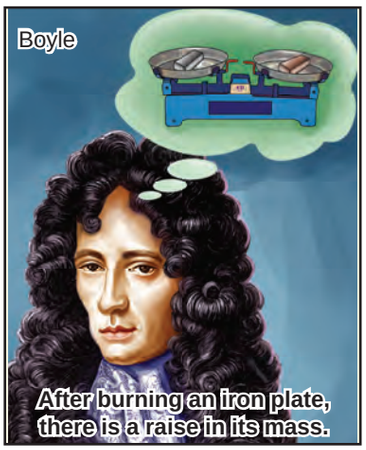

Lavoisier couldn't do his research without the precise instruments designed by Mary Anne.

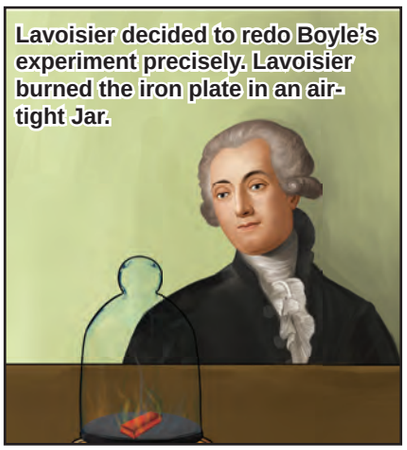

Mary Anne's role is as important as Lavoisier in all these discoveries.

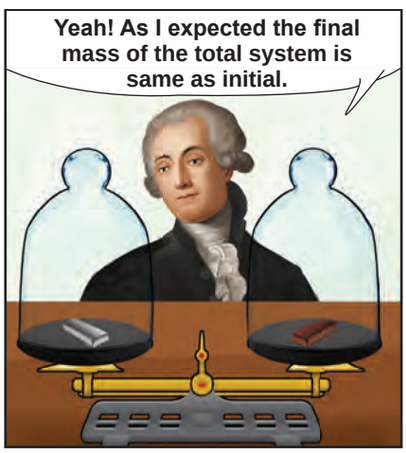

Boyle

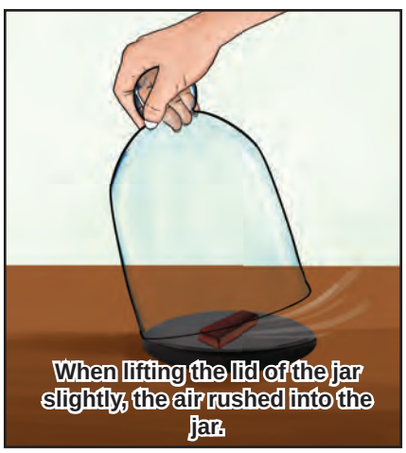

After burning an iron plate, there is a raise in its mass.

Lavoisier decided to redo Boyle's experiment precisely. Lavoisier burned the iron plate in an air-tight Jar.

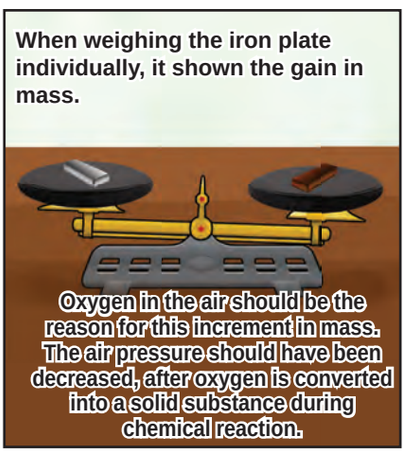

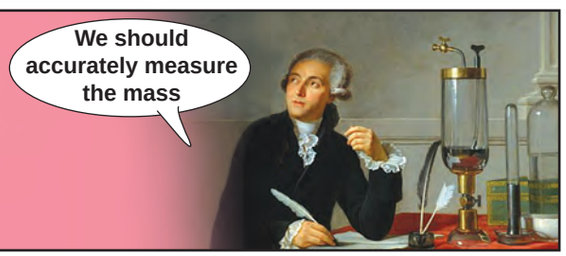

When lifting the lid of the jar slightly, the air rushed into the jar.

When weighing the iron plate individually, it shown the gain in mass.

Oxygen in the air should be the reason for this increment in mass. The air pressure should have been decreased, after oxygen is converted into a solid substance during chemical reaction.

In a chemical reaction, the initial and final mass should be same. so matter can never be created nor destroyed. With a chemical reaction, chemical compound may be changed. We can change the chemical composition of substances by chemical reaction
