There was an another surprise for him

What is this! The Large and small plates shows the same 2gm weight gain in this jar.

Yes! This should be the quantity of the oxygen in this jar.

After exhausting oxygen the chemical reaction is stopped; increasing of mass is also interrupted.

Lavoisier repeated his experiment so many times, and concluded that the quantity of the oxygen in the air should be 20%.

While respiration, we inhale Oxygen and exhale Carbon dioxide. Even when rusting, burning of substances, the same oxidation is occurred. So he told that our respiration is equivalent to slow burning.

Experiments of Lavoisier showed that air is a mixture.

Oh! Is air not a basic element?

Lavoisier proved that water is made up of oxygen and hydro-gen.

Water is not a basic element too.

In consequence of proving water and air is not basic elements the concept 'Panchaputha' was obsolete. Objects are made up of different kind of atoms.

A new era of modern chemistry started.

The book,
' Elements of Chemistry'
published by him in 1789 laid the foundation of modern chemistry.

Lavoisier remembered as the pioneer of the revolution in Chemistry.
