Activity

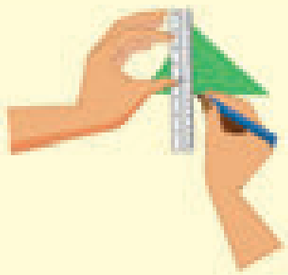

1. Consider a paper cut-out of a triangle. (Let us have an acute-angled triangle, to start with). Name it, say ABC.

2. Fold the paper along the line that passes through the point A and meets the line BC such that point B falls on C. Make a crease and unfold the sheet.

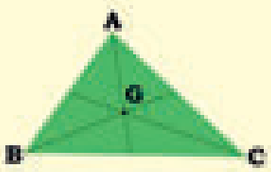

3. Mark the mid point M of BC.

4. You can now draw the median AM, if you want to see it clearly. (Or you can leave it as a fold).

5. In the same way, fold and draw the other two medians.

6. Do the medians pass through the same point?

Now you can repeat this activity for an obtuse-angled triangle and a right triangle. What is the conclusion? We see that,

The three medians of *any* triangle are concurrent.

5.6.1 Centroid

The point of concurrence of the three medians in a triangle is called its **Centroid**, denoted by the letter **G**. Interestingly, it happens to be the centre of mass of the triangle. One can easily verify this fact. Take a stiff cut out of triangle of paper. It can be balanced horizontally at this point on a finger tip or a pencil tip.
