Activity

1. A pair of identical 30°–60°–90° set-squares are needed for this activity. Place them as shown in the figure.

(i) What is the shape we get? It is a parallelogram.

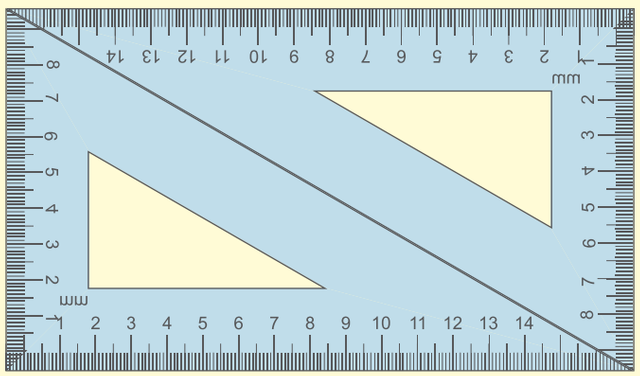

(ii) Are the opposite sides parallel?

(iii) Are the opposite sides equal?

(iv) Are the diagonals equal?

(v) Can you get this shape by using any other pair of identical set-squares?

2. We need a pair of 30°–60°–90° set- squares for this activity. Place them as shown in the figure.

(i) What is the shape we get?

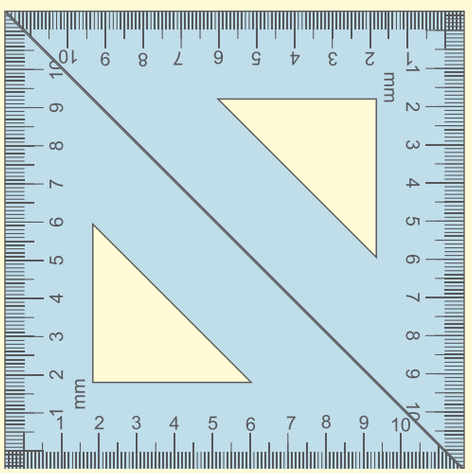

(ii) Is it a parallelogram?

It is a quadrilateral; infact it is a rectangle. (How?)

(iii) What can we say about its lengths of sides, angles and diagonals?

Discuss and list them out.

3. Repeat the above activity, this time with a pair of 45°–45°–90° set-squares.

(i) How does the figure change now? Is it a parallelogram? It becomes a square! (How did it happen?)

(ii) What can we say about its lengths of sides, angles and diagonals?

Discuss and list them out.

(iii) How does it differ from the list we prepared for the rectangle?
