Emulsions find wide applications in food processing, pharmaceuticals, metallurgy and many other important industries.

More to Know

Have you seen colourful patches on a wet road? When oil drops in water on road, it floats over water and forms a colourful film. Find out why.

Points to Remember

- Depending upon the chemical composition, matter is classified into elements, compounds and mixtures
- Elements and compounds are considered to be pure substances as they contain only one kind of particles whereas mixtures contain more than one type of particles and they are considered as impure substances
- In a homogenous mixture (true solution) the components are uniformly mixed and it will have single phase
- A heterogeneous mixture are not mixed thoroughly or uniformly and it will have more than single phase
- Based on the size of the solute particles heterogeneous mixtures can be classified as colloidal solutions and suspensions

A-Z GLOSSARY

Elements	A substance composed of atoms having an identical number of protons in each nucleus.
Compounds	A pure, macroscopically homogeneous substance consisting of atoms or ions of two or more different elements in definite proportions.
Mixtures	A composition of two or more substances that are not chemically combined with each other and are capable of being separated.
Solution	Homogeneous mixture composed of two or more substances.
Colloid	A system in which finely divided particles, which are approximately 1 to 100 nm in size, are dispersed within a continuous medium in a manner that prevents them from being filtered easily or settled rapidly.
Suspension	A suspension is a heterogeneous mixture in which solute-like particles settle out of a solvent-like phase sometime after their introduction
Emulsion	A colloid in which both phases are liquids: an oil-in-water emulsion.
Absorption	Process by which atoms, molecules, or ions enter a bulk phase (liquid, gas, solid)
Adsorption	Adhesion of atoms, ions or molecules from a gas, liquid or dissolved solid to a surface
Centrifugation	Sedimentation of particles under the influence of the centrifugal force and it is used for separation of superfine suspensions.
