

Flemming's Right Hand Rule

If we stretch the thumb, forefinger and the middle finger of the right hand mutually at right angles to each other and the thumb indicates the direction of motion of the conductors and the fore finger in the direction of the magnetic flux, then the middle finger indicates the direction of induced e.m.f.

Flemming's Left Hand Rule

SLTJFS

Flemming's Left Hand Rule

If we stretch the thumb, fore finger and the middle finger of the left hand mutually at right angles to each other and the forefinger indicates the direction of the magnetic flux and the middle finger is in the direction of induced e.m.f then the thumb indicates the direction of motion of the conductors.

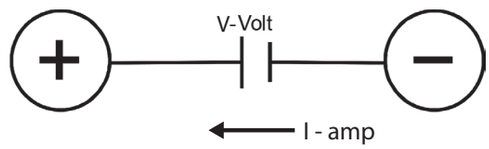

CURRENT

Types

1. Direct Current (D.C)
2. Alternative Current (A.C)

D.C FUNDAMENTALS

D.C means direct current and it is available from positive terminal (anode) and negative terminal (cathode). Current flows as electrons from negative potential to positive potential. D.C is generally produced by chemical processes as in batteries. D.C generators are used for generation of high capacity current. The current flows only in positive direction.

D.C Current

A.C FUNDAMENTALS

A.C means alternative current. Magnitude, direction of current and voltage alternate continuously. The flow of current changes direction periodically.
