Rotor

Rotor

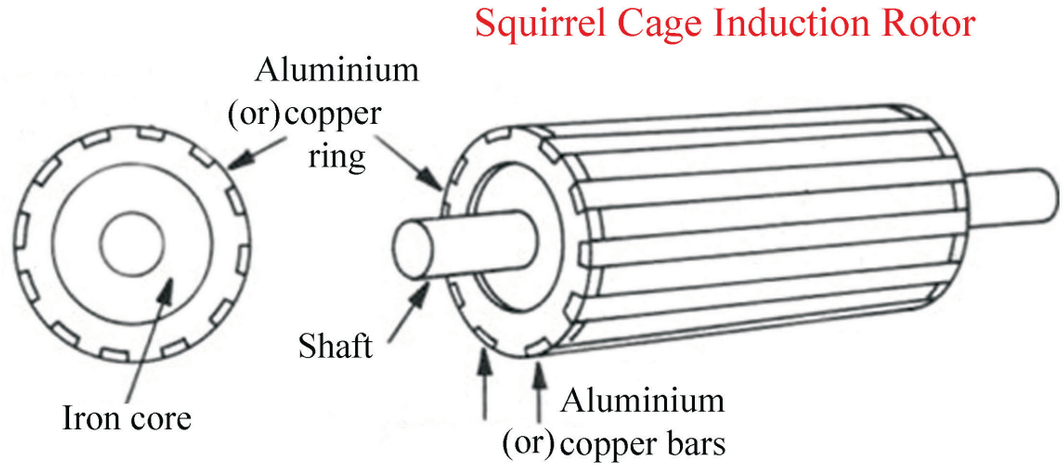

Based on the construction of the rotor, the three phase induction motor can be classified as

1. Squirrel cage induction motor
2. Slip ring induction motor

Construction of a Squirrel Cage Induction Motor

The rotor of a squirrel cage motor is made of cylindrical laminated core with small openings. These openings receive insulated conductors. The openings are formed parallel to the axis. So, the motor starts to run with a uniform rotating torque. Humming is reduced to a great extent. One bar is placed in each slot and all the bars are short circuited by two end rings. This makes a complete squirrel cage rotors.

There are two types of squirrel gauge induction rotors,
