Cavalier Drawing

In this type of drawing, two axes are drawn perpendicular to each other and the third is inclined at 45^0. It is made of the exact dimensions of the object. However, in many instances, this projections makes the view appear distorted.

Cavalier Drawing **Cabinet Drawing**

Cabinet Drawing

To reduce distortion, the dimensions of the object along the receding axis is drawn to half scale. The resulting view is called cabinet drawing.

Perspective projection

It is the projection of an object obtained on a plane when the projectors converge to a point. This projection does not represent the actual size of the object.

Orthographic Projections

It is the projection in which different views of an object are obtained on planes of projection when the projectors are parallel to each other and perpendicular to the plane on which the view is projected.

There are some assumptions to be made for obtaining orthographic projection:

1. The observer looks at the object from an infinite distance.
2. The lines drawn from various points on the contour of the object (projectors) are parallel to each other.
3. On projection from the object, these lines meet the plane (of projection) at right angles (the Projectors are perpendicular to the plane of projection)
4. The plane of projection is transparent.
