When the horizontal plane and auxiliary vertical plane are rotated after obtaining the projections, the views will be arranged as follows:

1. The top view is placed above the front view
2. The left side view is placed at the left side of the front view
3. The right side view is placed at the right side of the front view.

Views obtained in orthographic projection

Different views are obtained on different planes in orthographic projection. They are

1. Front View (or) Elevation
2. Top view (or) Plan
3. Right Side View
4. Left side View
5. View from Below
6. View form the Rear
7. Cut Section View
8. Auxiliary view

Front view: when the object is viewed from its front, the projection (or) view of the object obtained on the vertical plane, is known as front view. It is also known as Elevation. The details of length and height are found in this view.

Top view : when the object is viewed from its top, the projection (or) view of the object obtained on the horizontal plane, is known as top view. It is also known as Plan . Length and width details of the object are found in this view.

Side view: When the object is viewed from its side, the projection (or) view of the object obtained on the auxiliary vertical plane is known as side view. It can also be called as **side elevation.**

Auxiliary view: when the object is viewed from a direction which is not parallel to any of the three major axes, the projection (or) view obtained on a auxiliary plane is known as auxiliary view. When a specific detail which cannot be shown in any of the above three views is necessary to be shown, it is done so on auxiliary view.

Making orthographic projection from isometric view

The isometric view helps us in understanding the shape of the object but does not give the dimensional and inner details of the object. But these details are necessary for designing and manufacturing purposes. So, the need of orthographic projection becomes essential.

The object is viewed from the direction of arrow to obtain the front view. If the arrow is not given, the most prominent views is taken as front view. The other views are obtained by viewing the object in direction that are perpendicular to the one utilized for front view.
