type of Calipers are called as **"SPRING TYPE CALIPERS"**

Maintenance of Calipers

1. It should not be used on hot and rotating parts.
2. Heavy objects should not be placed on it.
3. It should be kept on flat surfaces.

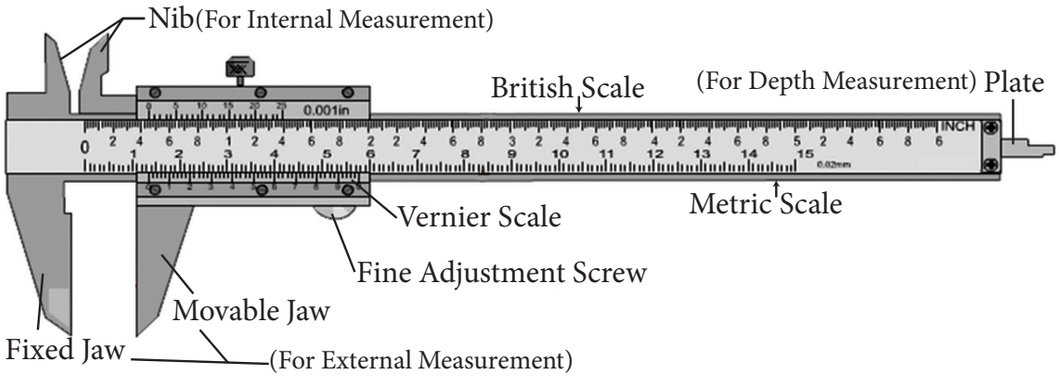

3.4 VERNIER CALIPER

Vernier Caliper is a precision measuring instrument. Vernier caliper was developed by French Mathematician Pierre Vernier in the year 1830 and the instrument is called after his name. Generally the least count of vernier caliper is 0.02 mm. In metric system and 0.01 inches in British System Diameter.

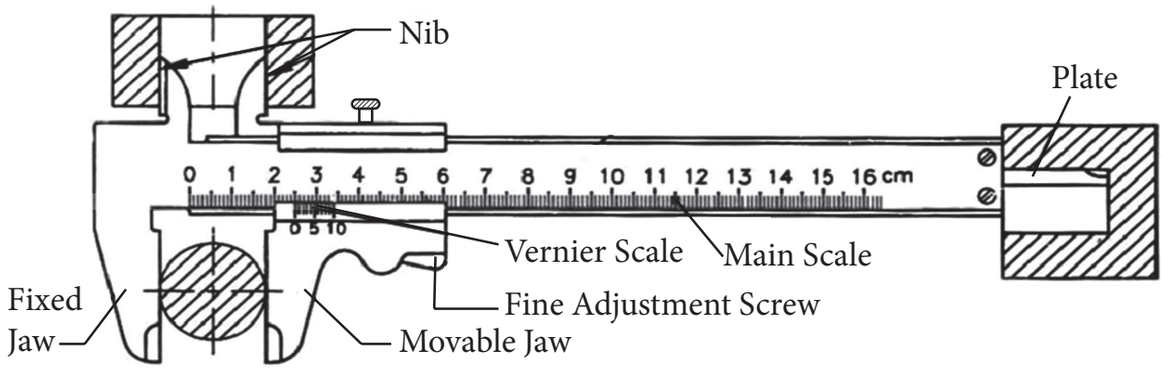

Vernier caliper is useful in measuring outer and inner diameter of hole and depth of holes. There are two important parts one is main scale and other is vernier scale. A fixed jaw is attached to main scale. Vernier Scale with movable jaw is slides over the main scale.

The object to be measured is held between the fixed jaw and movable jaw. The reading on both the main scale and the vernier scale are noted. (Two separate nibs are provided on the top side, for measuring inner dimension of any jobs.)

A narrow slot is provided on the backside for the main scale to accommodate a narrow plate. This plate is made to move along with the vernier scale to measure depth of holes and slots.
