4.9 Do's and Don'ts of Storage Battery

4.10 Nine Tips for Proper Battery Care

4.1 INTRODUCTION AND DEFINITION

Battery is a device that transforms chemical energy into electrical energy. Batteries consist of electro chemical cells that are electrically connected.

Every battery has two terminals. The positive one is called 'Anode' and negative one is called 'Cathode' as shown in and Fig 4.1.

Battery is a storage device used for the storage of chemical energy and for the transformation of chemical energy into electrical energy.

Battery consists of a group of two or more electric cells connected together electrically in series. Battery acts as a portable source of electrical energy.

Battery or cell is an electrochemical device consisting of two electrodes made up of different material and an electrolyte. The chemical reactions between the electrodes and the electrolyte produce voltage.
