4. IDENTIFY THE DISSOLUTION OF THE GIVEN SALT WHETHER IT IS EXOTHERMIC OR ENDOTHERMIC.

WVXNZT

Aim:

To test the dissolution of given salt is exothermic or endothermic

Principle:

If the reaction or process liberates the heat, then it is called exothermic.

If the reaction or process absorbs the heat, then it is called endothermic

Apparatus required:

Two beakers, Thermometer, stirrer ,weighed amount of two samples.

Procedure:

Take 50ml of water in two beakers and label them as A and B. Note the temperature of the water from beaker A and B. Then, add 5g of sample A into the beaker A and stir well until it dissolve completely. Record final temperature of the solution. Now, repeat the same for the sample B. Record the observation.

Observation:

S. No	Sample	Temperature before addition of sample (°C)	Temperature after addition of sample (°C)	Inference (temperature increases or decreases)
1	A			
2	B			

Result:

From the inferences made

The dissolution of sample A is _____(Exothermic or endothermic)

The dissolution of sample B is _____(Exothermic or endothermic)

Note:

Sodium hydroxide, ammonium nitrate, glucose, calcium oxide etc. may be given as the sample.
