

7. **Twisted Fibres:**

Twisted fibres are caused by the action of a prevalent wind turning the tree constantly in one direction. Timber thus injured is not fit for convertion, as so many fibres would be cut through.

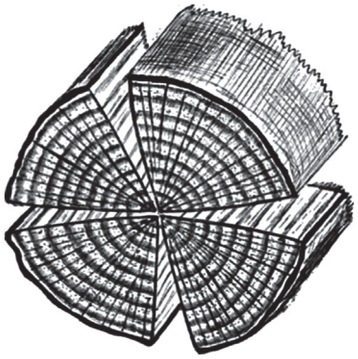

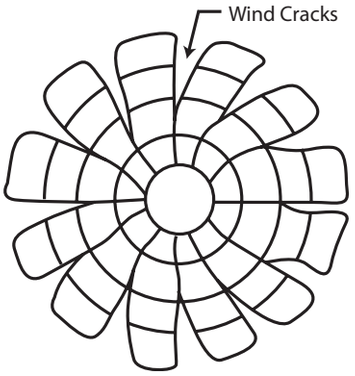

8. **Knots:** Sometimes branches or limbs are cut off from the tree. The portion from which the branch is cut off continues to receive nourishment from the stem for a long time and it ultimately results in the formation of knots.

9. **Wind Crack:** Wind cracks are shakes or splits on the sides of a bark of timber due to the shrinkage of exterior surface exposed to atmospheric influences.
