Ceramic Terracing Tiles: These tiles are flat tiles made up of well prepared and weathered clay and burnt in a kiln. They should be burnt uniformly. They can be hand-made or machine pressed. Usual sizes are 200 × 200 × 15mm and 150 × 150 × 15 mm. The thickness may vary from 15 - 20 mm.

Glazed Ceramic Tiles: These are of earthenware, having top surface glazed and underside unglazed, so that tile may adhere properly with the surface. A glaze is applied in order to improve the appearance, making it non-absorbent and increasing its durability. These tiles are made in different sizes.

Fully Vitrified Tiles: Vitrified tile is the ceramic tile with low porosity. It is an alternative to marble and granite flooring. These tiles are often used in outdoors due to their water and frost resistance. They are extremely durable and are made to endure heavy traffic.

Since the edges of these tiles are uniform, they can be laid with very close joint.

ACTIVITY 5

Collect different types of tiles with your class friends and display it in the class room.
