

2.2.6.4 Dimension Style

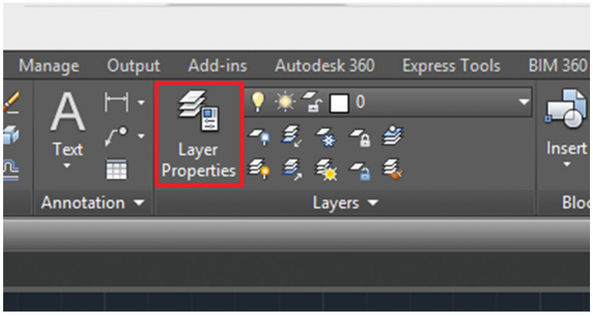

This command is used to select style for dimension.

2.2.7 Layer

It is very tough to understand a drawing, if we should show the full details of the object in the same drawing. When we prepare the manual drawing, we will give the details in several places of the object. If we want more information another drawing is to be drawn.

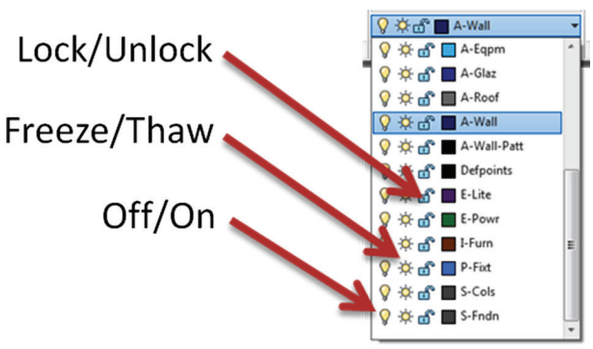

TCBL1I

To eliminate this problem, drawings are drawn in the layer method in AutoCAD. In this method, we can take print out of the object with required details.

2.2.7.1 Layer On / Off

This characteristic is used to switch off the unnecessary layer. When we switch off the particular layer, the drawing drawn in that layer will not be visible to our eyes. Also that drawing cannot be printed or plotted. That layer may be switched on when required.
