3.1.2.1 Geological Classification

According to this classification, rocks are of 3 types. They are:

TCP4R3

i) Igneous rocks
ii) Sedimentary rocks
iii) Metamorphic rocks

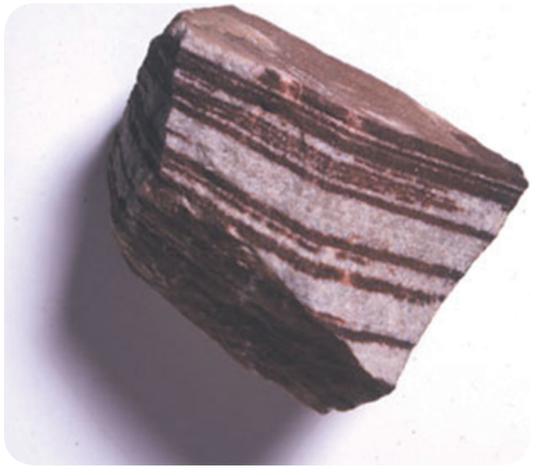

i) **Igneous Rocks** : Stones obtained from these rocks are very strong and durable. It is the result of cooling and consolidation of molten lava released by volcanoes. E.g. Granite, Basalt.

ACTIVITY 1

Collect images of recent volcanoes around the world and make an album.

ii) **Sedimentary Rocks**: They are formed by gradual deposition of broken pieces of rocks which are disintegrated by atmospheric actions. It is migrated from one place to another place and deposited at the bottom of rivers or lakes. These deposits harden due to water pressure. E.g. Limestone, Sandstone

iii) **Metamorphic Rocks:** They are igneous or sedimentary rocks. The change in colour, structure and texture are due to

DO YOU KNOW?

Which is the largest active volcano?

- The largest most active volcano on earth is 'Mauna Loa' in Hawaii(U.S.A), measured about 60 miles long and 30 miles wide (1800 sq. miles).'
- It has erupted 33 times since 1843 in the past 175 years
