3. PLEUROBRACHIA

Identification:

The given specimen is identified as **Pleurobrachia.** It belongs to the Phylum **Ctenophora.**

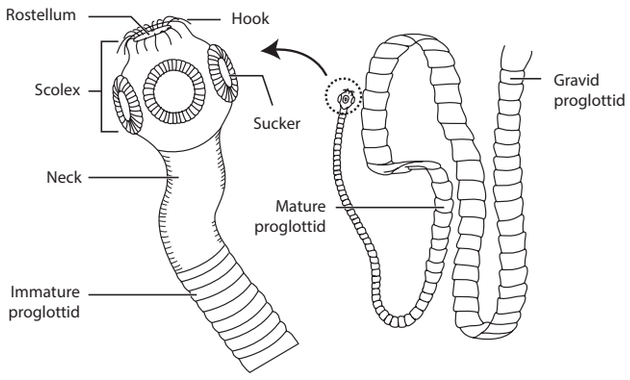

Reasons for identification:

- Pleurobrachia are exclusively marine, biradially symmetrical, diploblastic animals with tissue level of organisation.
- They have eight external rows of ciliated comb plates (comb jellies) which help in locomotion.
- Bioluminescence is well marked in ctenophores.
- They lack nematocysts but possess special cells called colloblasts which help in food capture.
- They reproduce only by sexual means. Fertilization is external and development is indirect and includes a larval stage called cydippid larva.

4. TAPEWORM

Identification:

The given specimen is identified as **Tapeworm.** It belongs to the Phylum **Platyhelminthes.**

Reasons for identification:

- It is a dorsoventrally flattened, triploblastic, acoelomate animal with organ level of organization.
- It is an endoparasite.
- Hooks and Suckers act as organs of attachment.
- Excretion is carried out by specialized cells called flame cells.
