**HOTS**

Cactus plant is green in colour and performs photosynthesis. Which part of this plant does photosynthesis?

## Points to Remember

- The plant body of flowering plant consists of two main parts. They are:
  1. Root system
  2. Shoot system
- Roots fix the plants to the soil. Roots absorb water and minerals from the soil.
- Stem is the ascending part of the plant axis. It has nodes and internodes.
- Leaves perform three major functions such as
  1. Photosynthesis
  2. Respiration
  3. Transpiration
- The surroundings where plants live are called their habitat
- The two major habitats are:
  1. Aquatic habitat
  2. Terrestrial habitat
- Adaptations are special features in plants which help them to survive in their habitat.
- Tendril is a climbing organ of some weak stemmed plants.
- Twiners have weak stem and they can not stand straight on their own.

## Evaluation

B43RHM

### I. Choose the correct answer.

1. Pond is an example of _____ ecosystem.
   a) marine b) freshwater
   c) deserts d) mountain
2. The important function of stomata is _____.
   a) conduction b) transpiration
   c) photosynthesis d) absorption
3. Organ of absorption is _____
   a) root b) stem
   c) leaf d) flower
4. The habitat of water hyacinth is
   a) aquatic b) terrestrial
   c) desert d) mountain

### II. Fill in the blanks.

1. Earth's surface is covered by _____ % of water.
2. The driest places on the Earth are _____.
3. Fixation and absorption are the main functions of _____.
4. Primary organs of photosynthesis are _____.
5. Taproot system is present in _____ plants.

### III. State True or False. If false, correct the statement.

1. Plants can live without water.
2. All plants have chlorophyll.
