Finding the angle of a regular hexagon using the equilateral triangle.

We shall find the angles of a regular hexagon using the equilateral triangle. Place the equilateral triangles in a regular hexagon as shown in the figure.

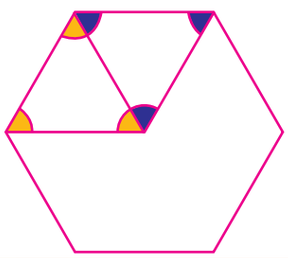

60° + 60° + 60° + 60° + 60° + 60° = 360°

Angle at the centre of a regular hexagon is 360°.
This is also the angle of a circle.

Angle at each vertex of a regular hexagon is 120°

60° + 60° = 120°
