Introduction

Our body needs nutrients like proteins, carbohydrates and fats for its proper functioning. We get these nutrients from the food we eat. If we do not take all these nutrients in right proportion, it results in some diseases. Sometimes, we do not preserve the food properly and it gets spoiled. Through the spoiled food also we get diseases. So, we need to preserve the food we eat. In this lesson we will study about spoilage of foods and the ways to preserve them, deficiency diseases, balanced diet and kitchen safety.

I. Spoilage of Food

Food items like fruits, vegetables, milk and meat will be fresh for very short period. These are called perishable foods and they get spoiled easily. Some food items like rice have long life time but they also decompose. The change in the normal state of the food is called spoilage of food. Spoiled food becomes unsuitable to eat. We can notice such changes from the taste and smell of the spoiled food. Eating spoiled food may cause diseases.
