For example, BMI of a person with 60 kg weight and a height of 190 cm can be calculated as below.

BMI = Weight in kg / Height in m^2

= 60 / 1.90 × 1.90

= 60 / 3.61 = 16.62 kg/m^2

If the BMI is over 30 kg/m^2 people are said to be obese. The range of 25-30 kg/m^2 denotes overweight.

Activity 3

Find your B.M.I

My B.M.I = $\frac{\text{My weight ____ kg}}{\text{My height ____ in } m^2}$

= -------- kg/m^2

IV. DISEASE

Disease is an abnormal condition that affects a living organism. This abnormal condition affects its structure and function. Diseases may be caused by external factors as well as internal dysfunction. Each disease has symptoms. We come to know about the diseases from their symptoms.

1 Causes of Diseases

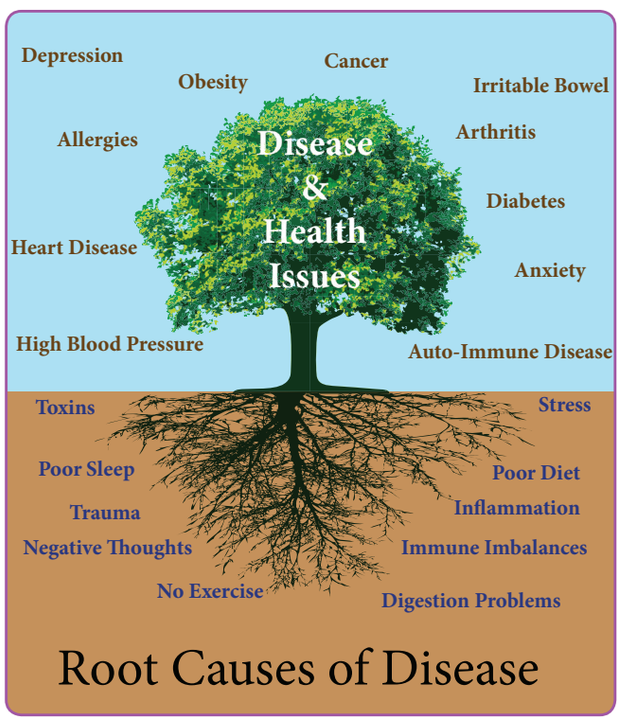

Diseases are mostly caused by micro-organisms like bacteria, virus, protozoa and fungi. They are transmitted by insects, and also through polluted air and contaminated water. Some diseases are caused when the function of the organ is affected. In general, causes of diseases can be classified as below.

- Metabolic factor. E.g. Diabetes
- Genetic factor. E.g. Colour blindness
- Microorganisms. E.g. Bacterial diseases
- Nutritional factor. E.g. Marasmus
- Environmental factor. E.g. Cholera

Activity 4

Find out the common disease prevalent in your area. Find out the reason for them and discuss with your teacher how to get remedy for them.
