3 Fertilization

The process of fusion of male (pollen grains) and female (stigma) gametes is called fertilization. The cell which results after fusion of these gametes is called zygote. The zygote then develops into embryo.

4 Fruits and Seed formation

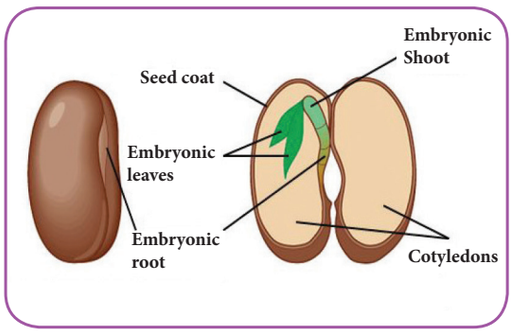

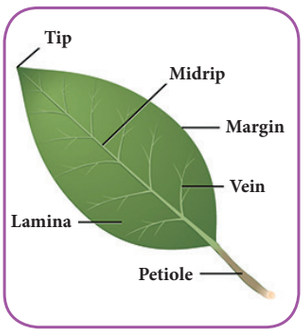

After fertilization, the ovary grows into a fruit and other parts of the flower fall off. The seeds develop from the ovules. The seed contains an embryo enclosed in a protective seed coat. Based on the number of cotyledons in the seed, flowering plants have been divided into two groups namely, dicotyledon and monocotyledon.

Activity 3

Collect seeds of different plants from your area. Find out whether they are monocotyledons or dicotyledons.

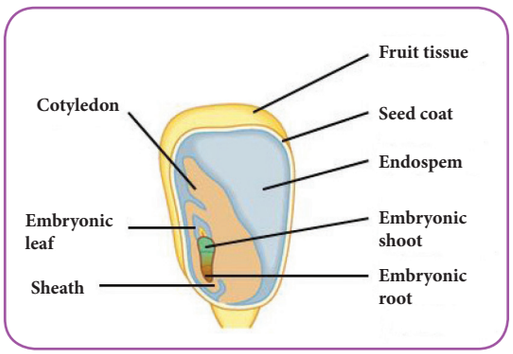

Dicotyledons have seeds with two cotyledons. E.g. Pea, Bean, Castor. They have leaves with netted venation and taproot system.

Mono cotyledons have seeds with one cotyledon. E.g. Maize, Rice, Wheat. They have leaves with parallel venation and fibrous root system.
