Stage 4: Butterly (Adult)

In the fourth stage the pupa opens and a butterfly comes out. A butterfly is sometimes called an imago. It is also called as adult. Butterflies are very colorful. When the butterfly first comes out it is very tired and so it rests. Then the butterfly will lay eggs and the lifecycle will start all over again.

❖ Viviparous animals

Animals in which the embryo develops inside the body are called viviparous animals. These animals give birth to the young ones. The developing embryo gets its nutrients from the mother. Humans, cows, deer and dogs are examples for viviparous animals.

Oviparous animals	Viviparous animals
The development of the embryo takes place outside the animal.	The development of the embryo takes place inside the animal.
They produce their young ones by laying eggs.	They directly give birth to the young ones.
The embryo receives the nutrients from the egg yolk.	The embryo receives the nutrients from the mother.
Examples for oviparous animals are insects, fish, reptiles and birds.	Examples for viviparous animals are cats, dogs, humans and lions.

Activity 1

Write down the names of any three oviparous and viviparous animals in the table given below.

Oviparous animals	Viviparous animals

2 Asexual Reproduction

The type of reproduction in which only a single parent, gets divided into two new offspring, is known as asexual reproduction. This type of reproduction takes place in micro organisms like hydra and amoeba. Asexual reproduction produces offspring that are identical to the parent. There are several ways by which animals reproduce asexually. Some of them are explained below.

❖ Fission

Fission, occurs in some invertebrate (organisams without back bone), multi-celled organisms. In this method, an organism splits itself into two parts. For example, flatworms, sea anemones and sea cucumbers divide into two halves and regenerate the other half in each of the resulting individuals.
