2. ***Preparation of coffee seeds and cocoa:*** Coffee berries are allowed to ferment so that pulp can be removed easily. The pulp from cocoa seeds are also removed by fermentation process.

3. ***Preparation of malt beverages:*** Malt beverages are prepared by the infusion of grains that have been subjected to malting (sprouting). This is also known as brewing. The enzyme in the grain converts starch into sugar producing an extract 'Wort'. This extract can be treated with yeast to obtain the final product beer and its varieties.

4. ***Bread and Idli making:*** When yeast converts sugar into alcohol, carbon – di-oxide is formed which helps in the raising of dough in bread. In case of idli and dosa batter the yeast naturally present on the grains make the batter to raise.

5. ***Cucumber pickles:*** Fresh cucumbers are cleaned and packed in salt resistant bacteria like *Lactobacilli* that forms lactic acid which preserves cucumber. This is then packed in fluids containing salt, vinegar, sugar and different spices.

6. ***Vinegar:*** It is a solution containing acetic acid, obtained by further fermenting alcoholic liquids with the help of the microorganism *Acetobacter.*

7. ***Milk Products:*** Butter and cheese are the milk products where microorganisms are utilized.

i. ***Butter*** – It is composed of fat from milk with little casein and lactose. It can be separated from fresh milk or curd. The organism *Streptococcus lactis* is helpful in acid forming and *Leuconostoc citrovorum* is responsible for bringing flavour and aroma in butter. Due to the action of yeast, mould and bacteria the butter gets contaminated leading to a fishy taste and yeasty flavor.

2. ***Cheese*** – It is prepared by coagulation of casein present in milk. Hard cheese is prepared by removing much of the water e.g. Cheddar cheese, swiss cheese. The cheese is ripened by the microorganisms such as *Streptococcus lactis* and *Streptococcus cremoris*. Moulds such as *Pencillium camemberti*
