Table 5.1 Types of Bakery Products			
No	**Method of Leavening**	**Examples of Bakery Products**	**Leavening Agent**
I	Yeast raised	Breads and sweet doughs	Leavened by carbon-di-oxide
II	Chemically leavened	Layer cakes, Doughnuts and Biscuits	Leavened by carbon-di-oxide from baking powders and chemical agents
III	Air-leavened	Angel cakes and Sponge cakes	Incorporating air into egg, sugar and flour mixture without baking powder
IV	Partially leavened	Pie crusts and certain crackers	No leavening agents are used

Types:

1. Bread 2. Cakes 3. Bun 4. Pastries
5. Biscuits 6. Cookies 7. Doughnuts 8. Crackers

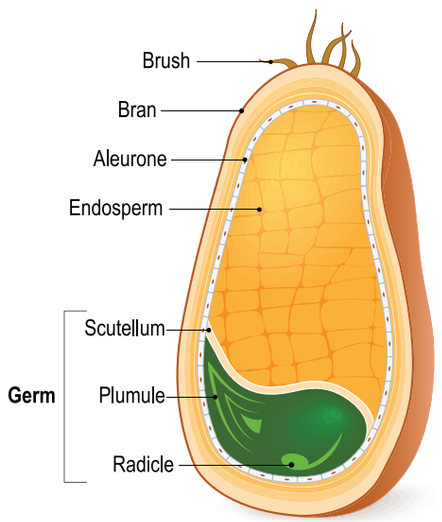

5.2 Baking Ingredients

1. Wheat flour / Maida
2. Leavening agents
3. Yeast
4. Baking powder
5. Eggs
6. Shortenings
7. Sugar

1. Wheat Flour / Maida

- Wheat is used principally for baking.
- Wheat contains 6–18 per cent protein.
- Wheat flour contains glutelin and gliadin as proteins which are commonly known as gluten (functional protein).
- The strength of the wheat flour is based on the quality of gluten used.
- The quality of baking is related to the strength of wheat.
- Maida is the refined wheat flour which is commonly used.

Structure of Wheat: Wheat grains are composed of outer bran coats, a germ and starchy endosperm.

▲ Plate 5.1: Structure of Wheat

a. Bran

- Bran is the outer layer of the kernel and constitutes 5 percent of the kernel.
- During milling the bran is discarded.
- Bran is rich in fibre, minerals, thiamine and riboflavin.

b. Aleurone Layer

- This is located just under the bran.
- It is rich in protein, phosphorous, thiamine and also contains moderate amount of fat.
- The aleurone layer makes up about 8 percent of the whole kernel and is lost in the milling process along with bran.
