e. Biscuit Flour

- Biscuit flour is made from weak wheat of low protein content.
- The flour should make a dough having more extensibility, but less spring (resistance) than bread dough.
- The extensibility of biscuit flour dough may be increased by the addition of sodium metabisulphite to the dough.
- Dough pieces should retain the size and shape after being stamped out.

f. Cake Flour

- Cake flour is a medium strength flour ground from soft low protein wheat of fine structure.
- This flour allows the aerated structure to be retained after the cake has been built up.

DO YOU KNOW?

Bleaching -
A chemical or enzymatic process employed to destroy the natural yellow colour of the flour due to plant pigments namely carotenoids.
Eg: Maida is bleached refined wheat flour

g. Pastry Flour: Pastry flour is made of soft wheat which is fairly low in protein.

2. Leavening Agents:

Leavening agents are substances that cause expansion of dough and batters by releasing gases. It produces porous structure in the baked products. The important leavening agents are as follows:

a) Yeast
b) Baking powder
c) Steam obtained from heating of the dough in the oven
d) Air in a dough or batter expands in the oven while heated
e) Carbon-di-oxide from fermentation.

3. Yeast: Two forms of yeast used in baking are

- moist compressed yeast
- active dry yeast

In the bread making process yeast ferments simple sugars and produces carbon-di-oxide and alcohol. The increase in fermentation rate with time is due to two conditions in a dough.

a) Yeast cells are multiplying and the enzymes are becoming more active while the dough is prepared and held.
b) Sugar for fermentation is gradually being liberated from starch in the dough by the action of natural flour enzymes.

4. Baking Powder: Baking powders are related foods that contain particles of sodium-bi-carbonate. Baking powders are of three kinds:

- Fast acting
- Slow acting and
- Double acting powders (contain both fast and slow acting in combination with sodium bi-carbonate).

5. Egg:

- Egg acts as principle structure builder.
- It adds flavour, colour and increases the nutritive value of the baked product.
