Chapter

4

GEOMETRY

E8L2N7

Learning Objectives

- To recall the types of symmetry through diagrams.
- To learn symmetry through transformation (Translation, reflection and rotation).
- To construct circles and concentric circles.

Recap

In class VI we have learnt the concept of symmetry. Now we shall recall them.

Line of Symmetry

Look at the *Fig. 4.1* given on the right.

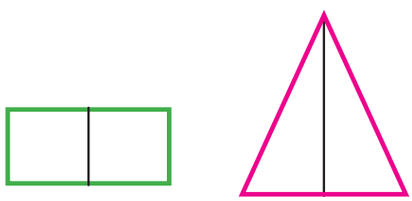

Fig. 4.1

In each figure a line divides the figure into two identical halves. Such figures are symmetrical about the line. The line that divides any figure into two equal halves such that each half exactly coincides with the other is known as the line of symmetry or axis of symmetry.

A figure may have one, two, three or more lines of symmetry. Some figures which has lines of symmetry are shown in *Fig. 4.2*.

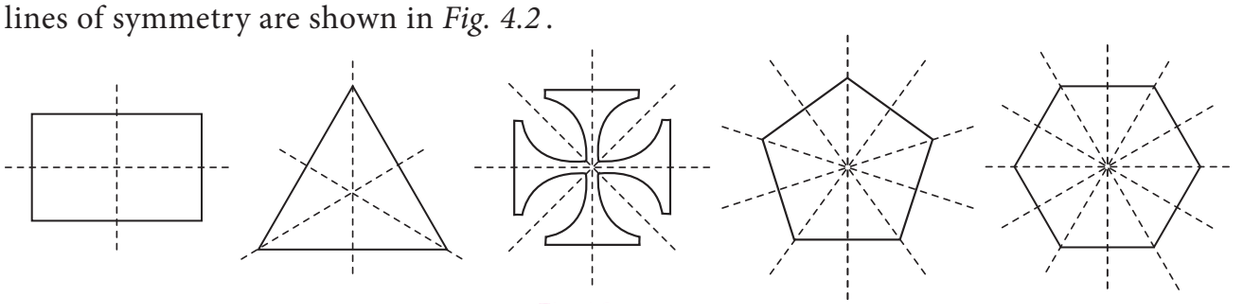

Fig. 4.2

Try these

1. Can you draw a shape which has no line of symmetry?
2. Draw all possible lines of symmetry for the following shapes.
