- Have a plan of action. Whether you are working alone or with a partner, know how to plan on moving the patient, what steps to be taken, and what to do if Plan A does not work.
- Communicate, both with the colleague and with the patient. When everyone is on the same plan, injuries are minimized and all efforts are more efficient. Use verbal commands, and know when to stop.

4.11.4 Types of moving, shifting and lifting patients:

1. Moving upward or downward:

Two nurses are required to do this. One nurse places her one hand under the patient's shoulder and the other hand under the lumbar region. The other nurse stands on the other side of the bed and does the same as the first nurse. The patient, if he is able, is asked to flex the knee and push against the matters with his heels. Both nurses together bring the patient up. ***See the figure below.***

2.Turning on one side:

Before turning move the patient a little away from the centre. If he is to be turned on the left side, the nurse must stand at his left. Keep his right arm crossed on the chest and right leg crossed over the left leg. Flex the right knee slightly, keep one hand on the patient's right shoulder and the other on his right hip and gently roll him to left lateral position.

3. Moving from one side of bed to another:

Move pillows towards the side of the bed. Place your one arm under the shoulders and the other under the lumbar region. ***See the figure above.***

4. Move upper part of the body to the side of the bed:

Then keep one arm under the lumbar region and the other under the thighs and move the middle part of the body of the side of the bed. Lastly place one arm under the things and the other under the ankles and move the lower part of the body to the side of the bed. See whether the whole body is straight and in good alignment.

5. Moving patients from stretcher to bed:

Keep the head of the stretcher at right angles to the foot of the bed. Three nurses are needed. All stand on the same side of the stretcher one nurse places her arms under the patient's head and shoulders, another
