

keeps her arms under the hips, the third has her arms under the thighs and legs. All together lift the patient, turn and place him on the bed. The lifters observe body mechanics for themselves. They keep their backs straight, flex their knees and place their one foot forward while transferring the patient.

6. Transferring from the Bed to Wheelchair:

7. Sit the patient up:

Lock the wheelchair. Help the patient turn over onto his or her side, facing you. Put an arm under the patient's neck with your hand supporting the shoulder. Put your other hand behind the knees. Swing legs over the edge of the bed, helping the patient to sit up.

8. Stand the patient up:

Have the patient scoot to the edge of the bed. Put your arms around the patient's chest and clasp your hands behind his or her back. Support the leg farthest from the wheelchair between your legs, lean back, shift your weight, and lift.

9. Sit the patient down:

Have the patient pivot toward the chair, as you continue to hold on. Always transfer toward the person's stronger side. As the patient bends toward you, bend your knees and lower the patient into the back of the chair.
