Problems of the Eye	Images	Causes and treatment
1. ***Blepharitis:*** Blepharitis is an inflammation of the eye lids. Usually, the skin near or around the eyes start to flake, the whites of the eyes turn red, vision becomes distorted, and people find their eyes to be itchy.		There are four main causes of blepharitis, which are: • Dust mites. • Dry Eye Syndrome. (DES). • Eczema. • Bacteria. • Treatment involves keeping the eyes and eyelids clean, and avoiding further contamination. Drops are usually prescribed.
2. ***Cataracts:*** It happens when a small mass forms in front of the eye, ranging from opaque to transparent. The eye still functions properly, but blindness is induced because the mass gets in the way.		• It effectively stops light from getting to the retina, leading to impaired vision. • A surgical procedure is required to remove cataracts.
3. **Eye Allergies:** Eye allergies are actually the world's first most common problem with the eyes. There are		• With allergies, the eyes become very itchy and red. The only cure is to prevent contact with the allergen.
