Problems of the Eye	Images	Causes and treatment
Strabismus (squint): The medical term for misaligned eyes is ***strabismus***. If strabismus (squint) develops in an adult, perhaps after a trauma to the head or after a stroke, the person is likely to experience double vision.		• Double vision occurs because the two eyes are looking at different images. • There are six different muscles that are attached to each eye to help it turn and rotate. • The eyes may not appear straight because one or more muscles are pulling too hard or other muscles are too weak. • There are different treatments for strabismus depending on the specific cause. • Some cases are managed with eye muscle surgery, some simply need glasses.

5.6.5 Exercises for the eyes.

Eye exercise	Demonstration
1. **Strengthen your eyes' near and far focusing:** This exercise will strengthen the muscles in your eyes and help you maintain your current vision level. Then, focus on an object that is 20–10 feet in front of you without moving your head. Focus on the object for 15–10 seconds. After 15–10 seconds, refocus on your thumb. Practice this five times.
