

form of exercise can increase heat production and thus body temperature.

- **Hormone level:** women generally experience greater fluctuations in body temperature than men. Hormonal variations during menstrual cycle cause body temperature fluctuation.

Temperature changes occur in women during menopause.

- **Circadian rhythm:** Body temperature normally changes 0.5° o 1°C during 24 hour period. The temperature is usually lowest between 1.00 AM and 4.00 AM.
- **Stress:** Physical and emotional stress increases body temperature through hormonal and neural stimulation. These physiological changes increase metabolism, which increase heat production.
- **Environment:** Environment influences body temperature. In a very warm room, the body temperature will be elevated. In a cold weather, the body temperature may be low because of extensive radiant and conductive eat loss.
