Degrees of burns

Types of burns

TYPES OF BURNS

- Thermal
  exposure to flame or a hot object
- Chemical
  exposure to acid, alkali or organic substances
- Electrical
  result from the conversion of electrical energy into heat. Extent of injury depends on the type of current, the pathway of flow, local tissue resistance, and duration of contact
- Radiation
  result from radiant energy being transferred to the body resulting in production of cellular toxins

Do you Know the facts in Burns?

- DO NOT break blister or otherwise interfere with the injured area
- DO NOT apply adhesive dressings or adhesive tape to the skin. The burn may be more extensive than the first
- DO NOT apply lotions and ointments to the injury; they can further damage the tissue and increase the infection.

Minor burns and scalds

Small and superficial burns are often caused by domestic accidents. Most can be treated by a First Aider and will heal naturally.

Treatment includes

- Flood the injured part with cold water for at least 10 minutes
- Gently remove any jewellery, watches, belts or constricting clothing
- Cover the area with a sterile dressing or some other clean material like plastic bag or kitchen film

Major burns and scalds

The longer the burning continues, the more the injury will be.

Treatment includes

- Lay the casualty down and protect the burned area from the ground
- Douse the burn with plenty of cold water for at least 10 minutes
