2.1 (a) Definition

Anatomy - A study of the structure of the body.
Physiology - A study of the functions of the body.

2.1 (b) Anatomical Positions

When a person standing upright with the head facing forward, arms by the sides and the palms of the hands facing forward and feet together is said to be anatomical position.

The body is wonderfully made, like a complex perfect machine. Each part is specially constructed to carry out its own function, and to work as a whole with other parts.

2.2 CELL BODY AS A WHOLE

All living things, including the human body, are made up of living cells. Cell is the structural and functional unit of human body. Just as many kinds of materials used in the construction of a large building, in the same way different kinds of cells are found in the formation of body.

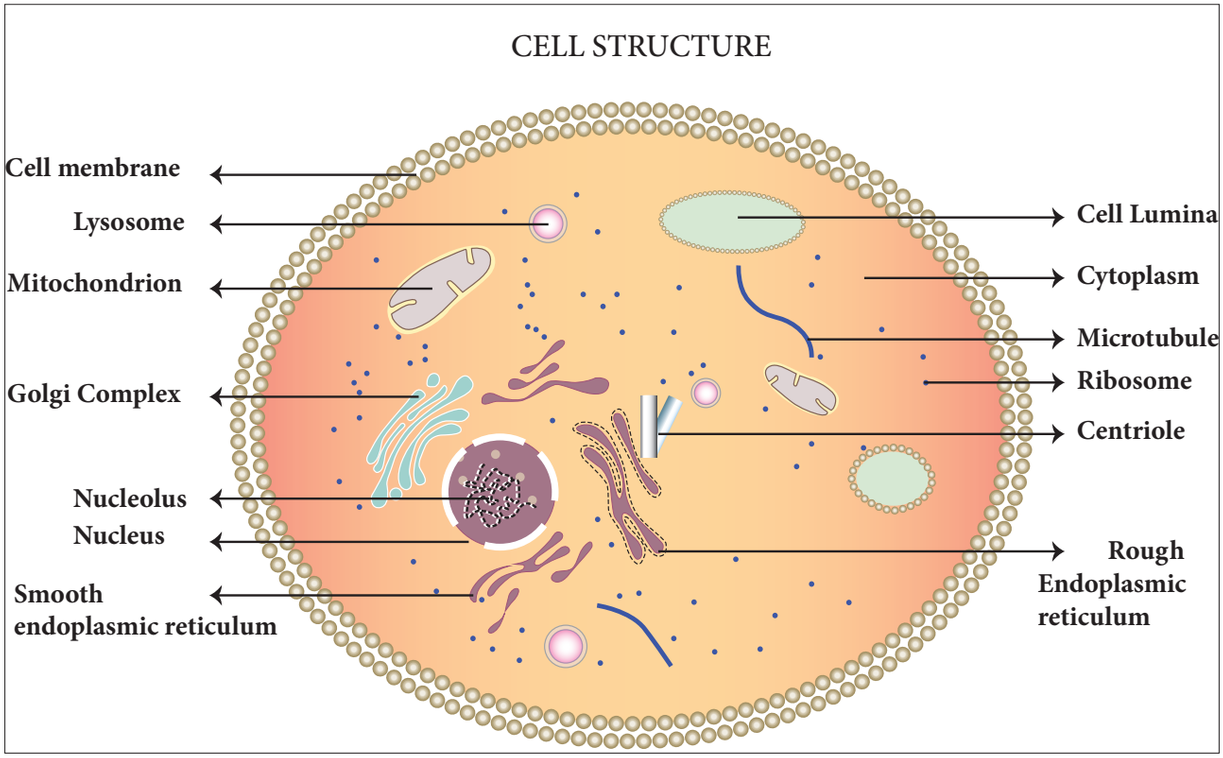

STRUCTURE OF A CELL

A cell has the following parts

- Cell membrane – the outer covering
- Protoplasm – main substance of the cell
- Nucleus – which controls activities of the cell.

FUNCTIONS OF THE CELL

Digestion – intake of nutrients
Excretion – elimination of waste
Respiration – taking in oxygen, and breathing out carbon dioxide
Growth and repair – increases the size of the cells and replacement of worn out cell.
