Reproduction – cells reproduce by two ways either mitosis or meiosis.

## TISSUES

There are five basic tissues, which makeup the organs of the body.

1. Epithelial tissue:
   It covers the internal and external surfaces of organs.
2. Nervous tissue
   It consists of neuron and dendrites with conducts nerve impulses.
3. Connective tissue:
   It supports and binds together all the other tissues.
4. Muscular tissue
   This tissue has the power of contraction which causes movement.
5. Sclerous tissue
   It is a special type of connective tissue mainly for skeletal system.

## ORGANS

Tissues are joined in larger units called organs eg. Heart, lung, brain etc.,

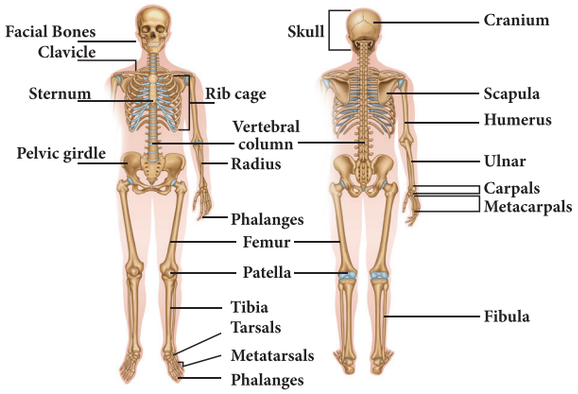

## SYSTEM

System is a group of organs, which together carry out one of the essential functions of the body. There are nine systems listed below.

## GLAND

A gland is a secretary organ, which function as a separate organ. There are two basic types of gland.

1. Endocrine gland – they pour their secretion directly into the blood stream eg. Thyroid, Adrenals etc.,
2. Exocrine gland – these discharge their secretions through ducts eg. Liver, pancreas etc.,

**Skeletal System**

| S.No | Systems of the body | Functions |
|---|---|---|
| 1. | Skeletal system | Support, movement and protection |
| 2. | Muscular system | Movements and productions of organs |
| 3. | Nervous system | Control of body activities |
| 4. | Circulatory system | Transport food, oxygen and waste products etc., |
| 5. | Respiratory system | Taking in oxygen and giving out carbon-di-oxide. |
| 6. | Digestive system | Taking in food, breaking it down into nutrients for absorption into body cells. |
| 7. | Excretory system | Removal of waste matter from the body |
| 8. | Endocrine system | Production of hormones which influence the activity of cells |
| 9. | Reproductive system | Enables new individuals to be born |
