Roller Bandages

Simple spiral

It is used for parts which are of uniform thickness, such as a finger or a wrist.

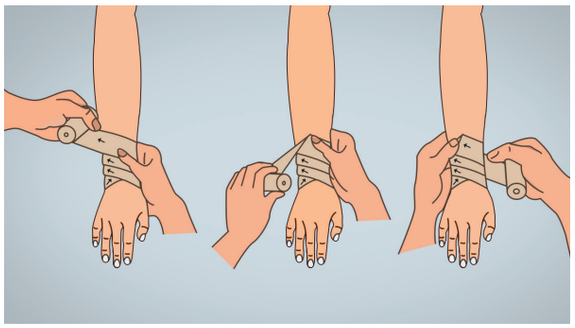

The bandage is applied obliquely round the part, each turn cover two thirds (2 / 3) of the proceeding one, and the edge being kept parallel.

Simple spiral

Reverse spiral

It is used for parts which vary in thickness and upon which the bandage of circular turns cannot be tied properly like leg and forearms. One or two simple spiral turns are usually made to carry the bandages to the point at which the spiral can no longer be employed. The bandage is then reversed and brought down and carried round the former one. These reverses are repeated as far as necessary and the bandage completed with one or two.

Reverse spiral

Figure of Eight

Is used for bandaging limb and for covering joints. In consists of series of
