2.3.7 Joint

Joint is a union between two or more bones. It is a device to permit movement.

Scientific study of joints is called arthrology

TYPES OF JOINTS

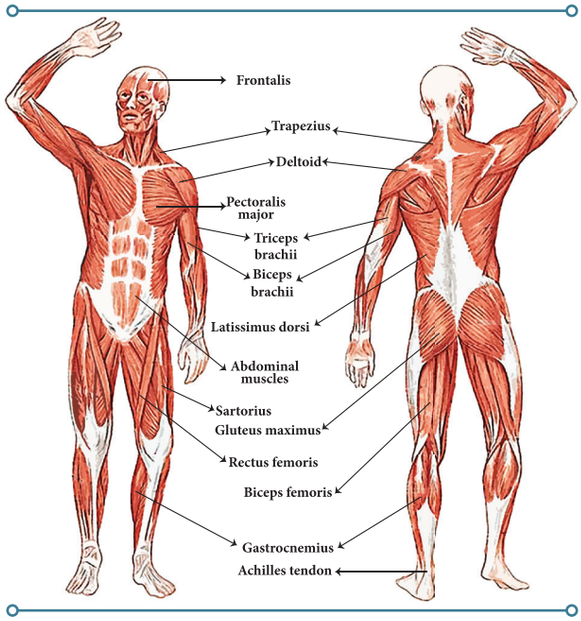

1. Fibrous Joints: In this joint there is no movement. Eg. Sutures of the skull. The bones are joined as though they were stitched (sutured) together.
2. Cartilaginous Joints: In which two bones are joined by a pad of fibrous cartilage, which allows slight movement. They are found in the vertebral column and pelvis.
3. Synovial Joints: Which are freely movable and found in the limbs and jaw.
4. Ball and Socket Joints: The round head of one bone fits into the cavity of another bone. Eg. Shoulder and hip joints.
5. Hinge Joints: The only movements are flexion and extension. Eg. Elbow, knee.
6. Gliding Joint: The bones glide on one another and allow fairly free movements. Eg. Wrist and ankle joint.
7. Pivot Joint: Turning is the only movement. Eg. The movement between the atlas and axis for turning the head.

STUDENT'S ACTIVITIES

1. Identity the joints with the given bones
2. Think and answer (Game)
   List of joints
   2 bones are joined together ..... joint
   3 bones are joined together ..... joint
   4 bones are joined together ..... joint
   5 bones are joined together ..... joint
   6 bones are joined together ..... joint
   7 bones are joined together ..... joint
   (etc)

2.4 MUSCULAR SYSTEM

Muscle is a contractive tissue, which brings movement. Muscles attached to bones of skeletal system forming
