impure or deoxygenated blood, and the left heart contains pure or oxygenated blood. Each portion is further sub divided into a superior and an inferior chamber. The superior chambers are called atrium and inferior chambers are called the ventricle.

The atrium communicates with the corresponding ventricle through an opening called an atrioventricular opening which is guarded by a valve.

The atrioventricular valve on the right side is called the tricuspid valve and the valve on the left side is called bicuspid or mitral valve. These valves permit the flow of blood in only one direction, that is from the atrium to the ventricle but not in the reverse direction.

HUMAN HEART

STUDENT'S ACTIVITY

Still model – heart
Working model – blood circulation

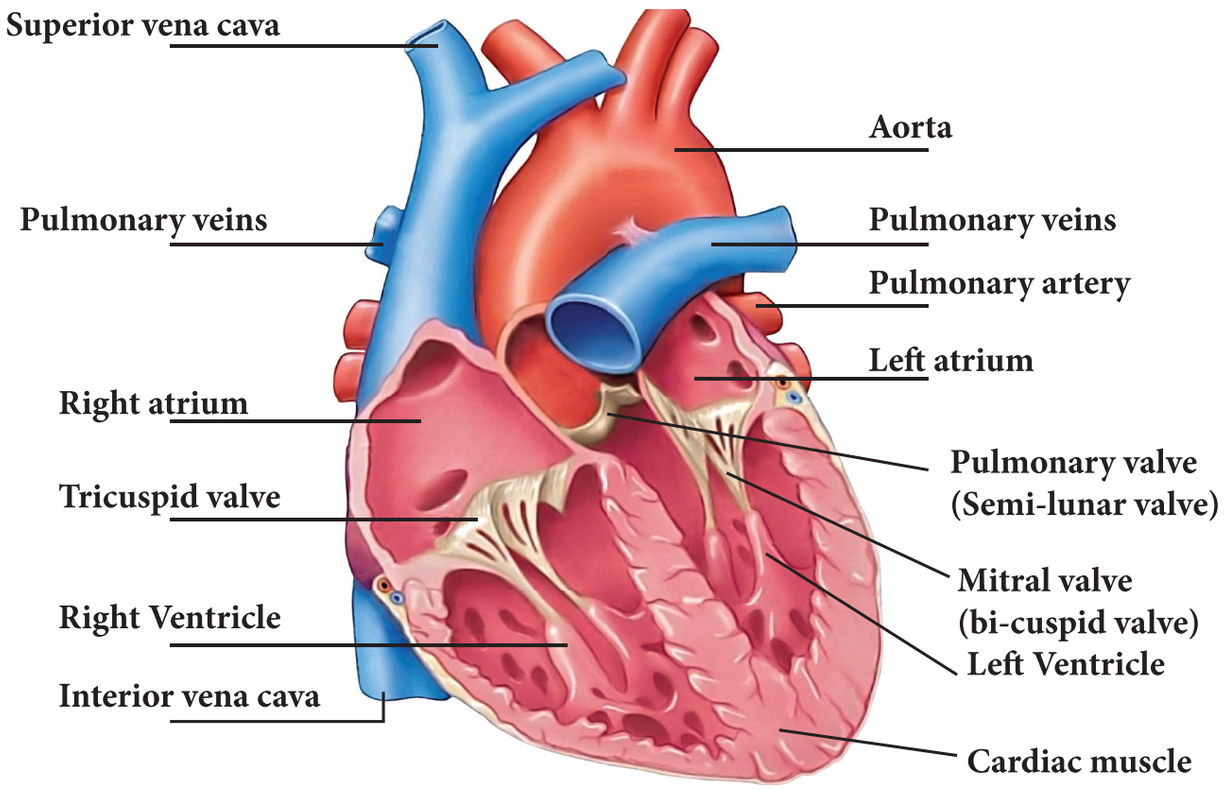

DO YOU KNOW?

Women's heart beats faster than men.

The human heart pump 182000000 (182 million) litres of blood during the average life time.

Pulmonary artery: The only artery which carries the deoxygenated blood.

Pulmonary vein: The only vein which carries the oxygenated blood.
