	Organ	Enzymes	Action
		Final products of digestion takes place in small intestine Carbohydrate - Glucose Proteins – Amino Acids Fats – Fatty Acids, Glycerol	
Faeces	Large intestine 		large quantity of water is absorbed.

DO YOU KNOW? A new born child breathe and swallow at the same time for up to seven months.

DO YOU KNOW? **At least 700 enzymes are active in the human body.**

2.8 RESPIRATORY SYSTEM

Functional unit of respiratory system is respiratory bronchiole.

Respiratory system consists of a group of organs which are designed to convey air and to provide a mechanism in which blood and air comes into intimate relation with each other, so that, gaseous exchange occurs between the oxygen of the air is absorbed by the blood and the carbon dioxide is eliminated into the air.

The exchange of gases between the body and the environment taking place in the lungs is termed as external respiration. The gaseous exchange between the tissues and the lungs is termed as internal respiration.

Respiratory system consists of the following organs

- Nose
- Pharynx
- Larynx
- Trachea
- Bronchi
- Lungs.

NOSE:

The nose is made up of cartilage and bone. It allows the passage of air. Air which passed through nose is moistened by mucus, warmed by blood and filtered by hairs and cilia. It opens at the back into the pharynx.

PHARYNX

The nose opens into the nasopharynx which leads below into larynx.

LARYNX

It is also called the wind pipe and is about 10 cm long. The lower end, of it divides into 2 bronchi. It is made up of 16-20 rings of cartilage which are connected to each other by fibrous tissue.

BRONCHI

These are two short tubes similar in structure to the trachea and each leads to one lungs. Each bronchus divides further
