EXCRETORY ORGANS

- Lung – Carbon Dioxide
- Kidney – Urine
- Intestine – Faeces
- Skin – Sweat

URINARY SYSTEM

Functional unit of kidney is nephron

Urinary system is the vital excretory system of the body.

Parts of the urinary system:

Parts	Functions
Kidney	Urine Formation
Ureter	Passes Urine to the Bladdder
Urinary Bladder	Storage of Urine
Urethra	Passing of Urine

KIDNEYS

The kidneys are bean shaped organs, lying on the posterior abdominal wall, one each side of the vertebral column. Each kidney measures 10-13 cm in length 2-3 cm in thickness and 6 cm in breadth. Each kidney weighs about 140 gms.

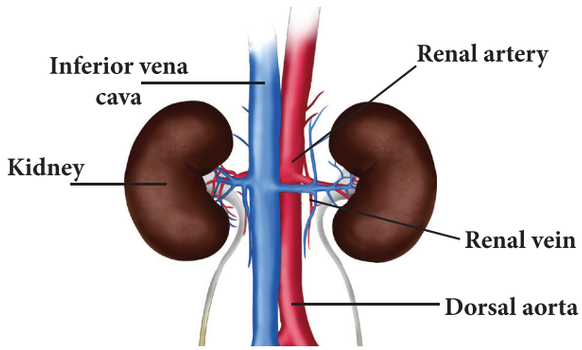

The kidneys are made up of basic units called nephrons. Each kidney contains about 10,00,000 nephrons approximately. A nephron has a t cup shaped part which acts as a filter part is connected to a long coiled tubule which carries the filtered liquid. All these tubules join together to form the ureter.

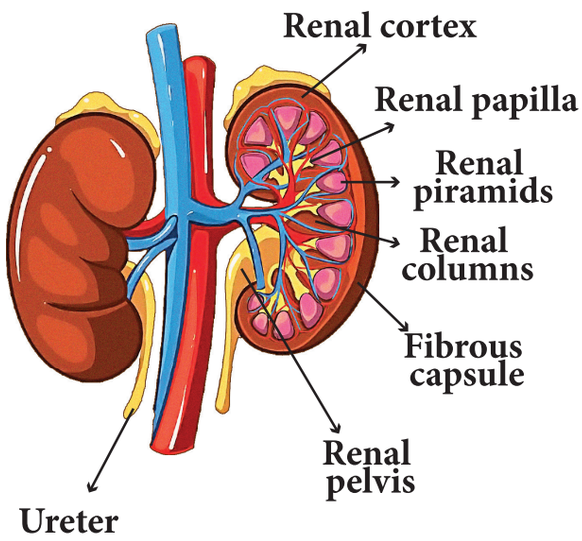

URETERS

It is a short tube passing from the kidney to the bladder. The bladder receives urine through the ureters and stores it. When the bladder is full to its capacity by a voluntary act the urine is expelled through an opening called the urethra. The male urethra is about 2.5-5 cm long.

FUNCTIONS OF THE URINARY SYSTEM

- Excretion of excess water and salts
- Excretion of metabolic waste products, drugs and toxic materials
- Maintaining water balance and acid base equilibrium of the body
- Maintaining the blood pressure by producing a substance called rennin
- Helping in the production of Red blood cells by secreting a substance called erythropoietin.
