Endocrine gland	Structure	Hormone	Functions
		Thyrotrophic stimulating harmone [THS]	Stimulates the activity of thyroid gland
		Adrenio corticotrophic harmone [ACTH]	Stimulates the production of harmones of adrenal cortex
		Follicular stimulating harmone [FSH]	Influences the growth, development and maturation of the ovarian follicles. Formation of sperms in testis
		-Prolactin hormone	Acts on mammary glands during lactation
		-Luteinising hormone	Stimulates ovulation in females Stimulates interstitial cells of tests to secrete testosterone
		Posterior Pituitary gland Oxytocin	Acts on muscles of the uterus during delivery – contractions
		Vasopressin	• Acts on smooth muscles of arterial system and increases the blood pressure • Decrease secretion – diabetes insipidus
Thyroid gland 	Largest of endocrine glands Located in the neck region It has 2 lobes seen on either side of trachea	Thyroxin	• Regulates tissue growth and development • Increases BMR thus raises body temperature • Stimulates breakdown of protein for energy • Decreases breakdown of fats • Helps in conversion of β carotens – vitamin A • Ca and P are removed from bones and excreted in increased amounts.
