Endocrine gland	Structure	Hormone	Functions
Para thyroid glands	Seen situated at the upper and lower poles of lateral lobes of thyroid glands	Para thyroxin	• Increases the reabsorption of calcium from bones • Increases the serum calcium levels • Increases the phosphate excretion in the urine stimulates lactation in mammary glands.
Islets of langerans in the pancreas.	Both exocrine / endocrine function is seen in pancreas The head of the pancreas is seen in the duodenum	Pancreas Alpha cells – glucagon Beta cells - insulin	• Increases the blood glucose level • Breakdown of glycogen into glucose in liver • Stimulates the breakdown of fat in adipose tissue.
Adrenal gland	Also called supra renals It seen above the kidneys <u>Adrenal glands</u> Adrenal cortex Adrenal medulla	Glucocorticoids	Cause increase in blood sugar.
		Minerlocorticoids	Acts on Na & K and help in conversion of Na in the body.
		Sex steroids	Development of reproductive organs and secondary sex characteristics.
		Adrenaline	Increases heart rate and increases BMR.
		Nor-Adrenaline	Decreases heart rate.
Male sex glands Testis	Seen inside the scrotal sac	Testosterone	Responsible for secondary sex characteristics.
Female sex glands Ovary	Seen on the either side of the uterus	Estrogen	Development and functioning of female reproductive system.
		Progesterone	Assists in normal development of pregnancy.
