THE FEMALE REPRODUCTIVE ORGANS

External organs [The vulva]	Internal organs
Mons pubis Labia majora Labia minora Clitoris Vestibule Vagina Perineum	Ovaries Fallopian tubes Uterus Vaginal canal

The female reproductive organs:

The external organs form the vulva.

They are as follows:

Mons veneris or pubic Mont lies over the symphysis pubis, and is covered with hair after puberty.

Labia majora or the outer lips, form the sides of the vulva.

Labia minora or smaller lips are seen within the labia majora. They are moist by gland secretions.

Clitoris is a small sensitive organ with erectile tissue.

The urethral opening is seen between the Clitoris and vaginal opening.

Vagina is a muscular tube lined with membrane of special type of stratified epithelium, well supplied by blood vessels and nerves. The vaginal canal form vaginal opening to the external os of the uterus.

Perineum is the area from the vaginal opening back to the anus. The gonads of the females are called ovaries, they produce egg cells, ova. When the ovum matures, the graffian follicle burst and ruptures is called ovulation. The function of the fallopian tube is to collect the ovum which is discharged from the ovary, and pass it to the uterus where it reaches the endometrial layer of the uterus.

The uterus is a pear shaped muscular organ. It measures about 7.5x5x2.5 cm and weighs about 60gm. The parts of the uterus and fundus [upper], body [middle], cervix[lower pole].

The walls of the uterus is in 3 layers perimetrium [outer], myometrium [middle], endometrium [inner].

FUNCTIONS OF THE UTERUS

- Menstruation – changes in the endometrium under the influence of hormones
- Pregnancy – the uterus receives the fertilized ovum and develop as foetus.
- Labour – contractions to expel the foetus and placenta
- Involution – gradual return to normal size of the uterus following delivery.

FEMALE SEX HORMONES

Estrogen and progestron.

CONCLUSION

In this chapter, we learned about the human body organs – structure and its functions. The Body is made like a complex perfect machine. Each body is specially constructed to carry out its own function. The body consists of head, neck, trunk, upper limbs and lower limbs. The body has a strong frame work of bones called as skeleton. Human body is made up of living cells. Each cell has cell membrane, protoplasm and nucleus. The functions of the cells are digestion, excretion, respiration, growth and repair and reproduction. Tissues are made up of group of similar cells. Tissues are joined into larger units as organs. A system is group of organs. skeletal system, muscular, system, nervous system, circulatory system, digestive system and reproductive system respiratory system, excretory system, endocrine system are systems of our body.
