Perceptual constancy depends upon several factors like past experience, expectancy, habits, motivations, cognitive styles, learning, imagination, etc.

Perceptual Constancy

➢ **Perceptual Constancy**

Perceiving Objects as unchanging even as illumination and retinal image change.

- ➢ **Color**
- ➢ **Shape**
- ➢ **Size**

3.9.1 Types of perceptual constancy

There are different types of perceptual constancies. They are shape and size, brightness and colour, size etc.

3.9.2 Errors in Perception

- **Illusion** - Illusion is a false perception. Here the person will mistake a stimulus and perceive it wrongly. For example, in the dark, a rope is mistaken as a snake or vice versa. The voice of an unknown person is mistaken as a friend's voice. A person standing at a distance who is not known may be perceived as a known person. Most of our illusions is visual and auditory.

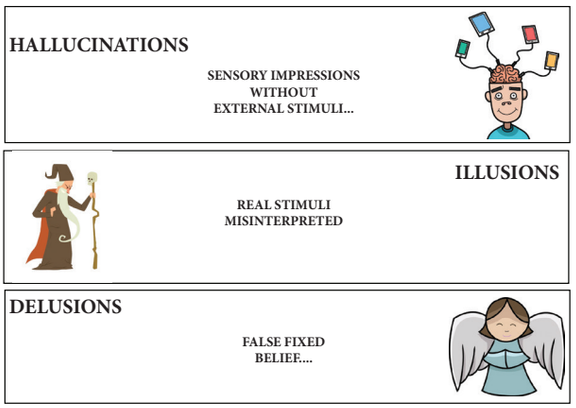

RYG6Y2

ERROR OF PERCEPTION

Hallucination - Perception without actual stimuli.

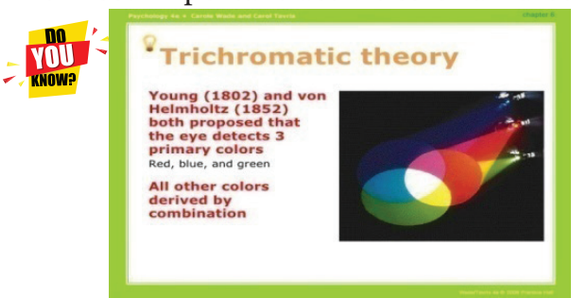

Illusion - An incorrect perception caused by a distortion of visual sensations.

- **Hallucination**- Sometimes we come across instances where the individual perceives some stimulus, even if it is not present. This phenomenon is known as hallucination.

3.9.3 Observation and Nurse:

Good and keen observational ability is an essential characteristic of a nurse. The most important activities of a nurse

include observation of changes in pulse, respiration, heart beat and blood pressure because they indicate general condition of a patient. The condition of the postoperative case, the emergency cases also require accurate observation.

Observation involves attention and perception. The nurse should always concentrate her attention on duties.

Distraction of attention may lead to serious consequences like death of a patient. Attention helps to understand the problems
